

ABSTRACT

An image forming apparatus includes an image forming system having a pickup roller (36a) that extracts and supplies a recording paper (P) housed in a paper cassette (33), a photosensitive drum (31b) that forms an image on the recording paper (P) supplied by the pickup roller (36a), and the like. In the case that multi-feeding has occurred in which when the pickup roller (36a) supplies a first recording paper (P1) another recording paper (P2) is also supplied, and the first recording paper (P1) is between the photosensitive drum (31b) and the other recording paper (P2), image forming processing for the first recording paper (P1) by the image forming system is continued.
